OpenAI Codex Community Hackathon, Bengaluru, 10 October 2026

HELD

Guardian

Stops scams at the one moment that matters: right before the money moves.

Built on OpenAI's DevDay 2026 launches: Decisions API, GPT-6.1 Sol, ChatGPT plugins, Agents API and Dots

Drishtant Ghosh - Drix10.com

The scams fraud systems can't see

₹22,845
crore lost to cyber fraud in India in 2024, up 206% in a year

₹1,616
crore to "digital arrest" scams alone, January to September 2024

$12.5B
in reported fraud losses in the United States in 2024

In every case the victim pays with their own phone and PIN. To the bank, it looks like a normal payment.

Sources: I4C / Ministry of Home Affairs; The Wire; US Federal Trade Commission

Why today's defences miss it

Card-fraud rules

Catch stolen cards and passwords. These payments are authorised by the victim, so nothing looks stolen.

Spam filters

Judge one message at a time. A digital arrest is a story told over hours, on a video call.

The payment itself

The last moment the loss can still be stopped. After that, UPI settles in seconds.

So Guardian sits exactly there: inside the payment, before the money moves.

Amma types nothing.

Someone in a digital-arrest call is scared and watched on video. She won't upload screenshots. Guardian reads what the payment app already knows, and decides before the money moves.

One decision, in about 200 milliseconds

Signals

On a call? Unknown caller? Amount vs her usual? Payee age and scam reports. Chat or screenshots if shared.

Decisions API

One call, six bounded questions, calibrated probabilities back.

Safe policy

Clear under 35%. Check from 35%. Hold at 80% or more.

Family decides

Rahul blocks or approves in ChatGPT. Her phone updates live.

Guardian only acts alone when the model is confident. Everything in between goes to a person.

A live digital-arrest call, nothing typed

What the phone noticed, automatically

Call	**WhatsApp video call with an unknown number, 38 minutes**
Amount	₹4,50,000: 30 times her usual largest payment
Payee	"RBI Verification Cell", first payment ever
Account	UPI ID opened 3 days ago, 7 scam reports

100%

chance this is a scam

HELD

"You're on a call with an unknown number. You can hang up."

Five DevDay launches, one product

OpenAI launch	What Guardian does with it
Decisions API	The core: six questions in one call, over text and screenshots, with calibrated probabilities
GPT-6.1 Sol	Explains why in plain English or Hindi, only for the few flagged payments
ChatGPT plugins	Family dashboard in the ChatGPT sidebar; @Guardian card with Block and Approve
Agents API	An OpenAI-hosted shopping agent must ask Guardian before it pays
Dots	Rahul's Dot researches the payee and can block alone, never approve without him

Measured: our own Structured-Outputs fallback on the same questions took 2.6 s; the Decisions API took 0.26 s, with probabilities.

Tested on 38 payments before the demo

19/19

scams held before the money moved

0/19

genuine payments wrongly held

4/4

scams held with nothing typed

185ms

typical decision time

The genuine ones were chosen to be hard: a son abroad asking for fees, a real police e-challan, a ₹2.4 lakh hospital bill. 36 automated tests guard the rest.

A small, hand-labelled set: a sanity check, not a production benchmark. Thresholds would be re-calibrated on real reported cases.

For her AI agents, and her family's

AI agents pay for us now

An OpenAI-hosted shopping agent (Agents API) is lured to a lookalike Amazon checkout. Before paying it must ask Guardian, through the same plugin ChatGPT uses.

Held at 99%. The agent refuses to pay.

Rahul's Dot handles the hold

When a payment is held, Rahul's Dot researches the payee and reaches him wherever he is. It may block on its own.

It can never release money without his yes.

How we chose the problem

1. Mapped all 31 DevDay 2026 launches, then went deep on the Decisions API, Dots and plugins
2. Surveyed about 1,000 decision-model projects to find what was saturated and what was open
3. Scored 23 problem spaces, global and India-scale, on impact, novelty and demo-ability
4. Studied about 30 winning projects from Codex and OpenAI hackathons on four continents
5. Stress-tested three finalists; Guardian scored highest

The gap: nobody had built a scam interceptor that reads screenshots and loops in the family.

Generating payments is easy. Deciding which ones to trust is the bottleneck.
